

Calibrating Γ -sensitivity to match Drela's $m(H_k)$ on the Falkner-Skan family

separation

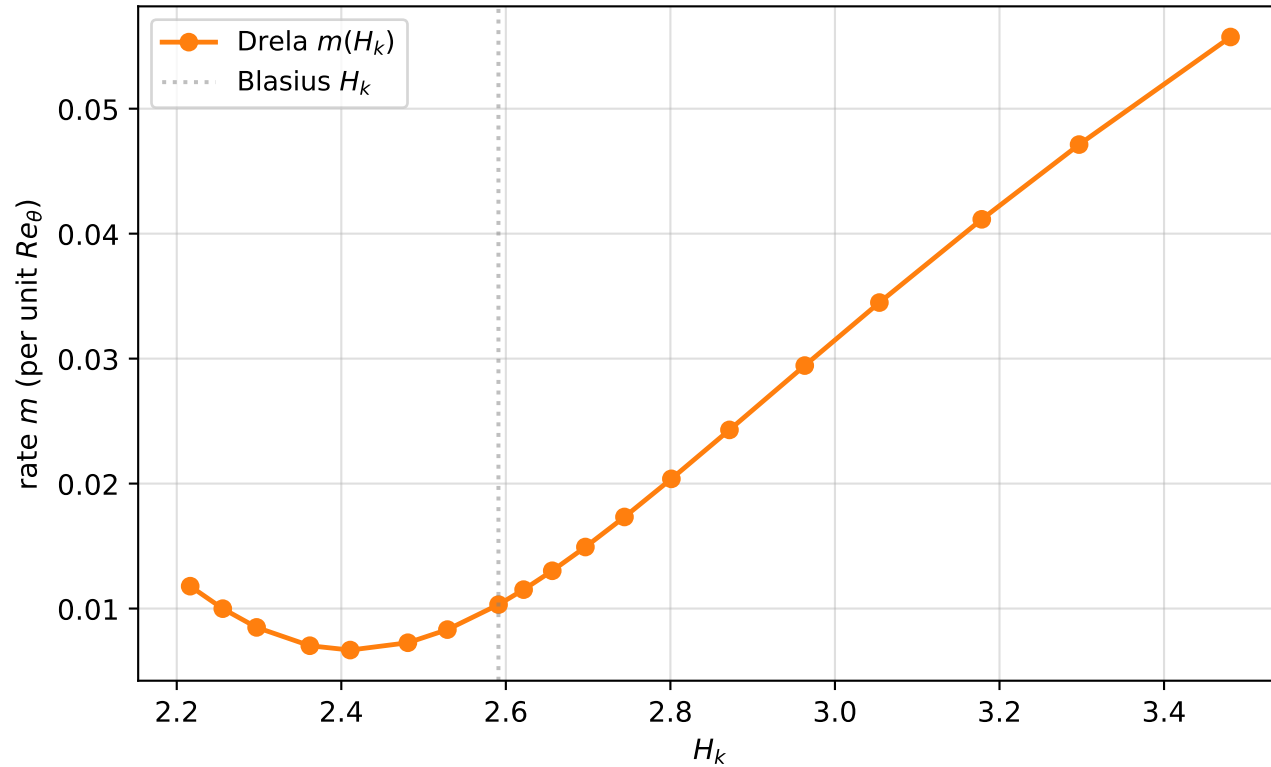

Falkner-Skan sweep: $H_k(\beta)$ and $\Gamma_{\max}(\beta)$

Mapping: $\Gamma_{\max}(H_k)$ along FS family

Drela's $m(H_k)$ — the target rate curve

How sensitive should $a(\Gamma)$ be? Match to Drela $m(H_k)$ on FS
