

Sharp-cliff amplification kernel ($p = 4$ barrier)
 Background: $a = a_{\max} \sigma(s(\Gamma - g_c)) \cdot [1 - (Re_{\Omega}^c/Re_{\Omega})^p]$, $Re_{\Omega}^c(\Gamma) = \max[100, 10^2 + (1 - \Gamma)/0.50]$
 Falkner-Skan trajectories at $Re_{\theta}^{\text{crit}}(H_k)$ (Drela). Stars = kernel-peak.
